

DOT-106A500X Ton Containers

106A500X Ton Tank for Chlorine Service

Carbon steel DOT Class 106A forge-welded multi-unit tank car tanks or "ton tanks" for chlorine or other aggressive gases, such as anhydrous ammonia and sulfur dioxide.

CBC Global DOT-106A containers have the exclusive safety-engineered feature of "inverted heads" if a container is accidentally over-pressurized, the heads will reverse (become convex), providing an immediate visual indication of over-pressurization. The reversed heads also create additional capacity to reduce the pressure and provide valuable time for corrective action.

Our DOT-106A tanks are independently inspected by our resident-authorized inspection agency to meet US DOT 106A500X specifications, Chlorine Institute drawing #197.2, and IMDG Code (CA 1996070013). We manufacture both standard and metric capacity models.
